

# Marketing Audit & Plan

|                   |                                                                        |
|-------------------|------------------------------------------------------------------------|
| Client            | [REDACTED]                                                             |
| Location targeted | Pakistan (all cities)                                                  |
| Channel reviewed  | Meta (Facebook & Instagram) advertising, and the live website          |
| Period covered    | 16 March 2026 – 26 September 2026 (the full history of the ad account) |
| Prepared by       | Digital Marketing Remote                                               |
| Date              | 26 September 2026                                                      |

## 01 Overview

[REDACTED] sells homemade preserves and condiments – fruit jams and marmalades, tomato and chili-garlic ketchup, and and robust chutneys, which – direct to customers across Pakistan from its own online shop, with 36 products currently listed between Rs 400 and Rs 2,000 and a typical price around Rs 800. Almost all of the money the business has spent on advertising has gone to Facebook and Instagram, and the single biggest seller is not one jar but a two-jar bundle. Since the shop opened its advertising in March 2026 it has spent Rs 262,416 and brought back Rs 758,874 in orders – a little over two and a half rupees back for every rupee spent. This report sets out what we found when we went through that account and the website line by line, and what we would change.

## 02 What we found

Everything below was checked directly inside the [redacted] advertising account and on the live website on 28 September 2020. Figures may slightly differ from time to time because our campaign is still running. There are no recommendations in this section – those come afterwards.

**The short version.** The advertising works, it has returned Rs 1,450 for every rupee spent across 388 orders. But almost all of it is collected off right now, the money that was spent was split evenly across audiences and placements that perform very differently from one another, and several things on the website are quietly eating the profits the ads pay for.

### Everything that sells is currently switched off

Of [redacted] campaigns, only one is running — and it is not a selling campaign. Every campaign built to generate orders is paused. The one that campaign is set to a “brand awareness” goal. It is paid to show the brand to as many people as possible, not to sell anything. It has reached 227,178 people at Rs 27.88 per thousand and has produced no orders, which is exactly what a campaign with that goal is designed to do. At Rs 1000 a day, the shop is currently paying for visibility and nothing else.

The campaign that made the most money has been off since it stopped. [redacted] “Bundle Offer” produced 188 orders at Rs 476 each — the best cost per order in the account, and roughly half of every order the business has ever generated from advertising. It is paused.

### Where the money went

**The seven campaigns that account for most of the spend**

| Campaign                       | Status | Orders                | Spent (Rs) | Cost per order (Rs) |
|--------------------------------|--------|-----------------------|------------|---------------------|
| [redacted] Bundle Offer        | Off    | 188                   | 88,400     | 470                 |
| New Year New Bundle Offer      | Off    | 181                   | 37,800     | 209                 |
| [redacted] Instagram Only      | Off    | 45                    | 45,000     | 1,000               |
| [redacted] New Bundle Strategy | Off    | 38                    | 38,700     | 1,018               |
| [redacted] New Profile View    | Off    | 0 (profile view only) | 11,200     | -                   |
| [redacted] Test                | Off    | 10                    | 5,000      | 500                 |
| [redacted] Test Account        | Active | 0 (business only)     | 4,000      | -                   |

The remaining 10 campaigns are smaller, and mostly focused goals. Between them they account for 10 of the 388 orders.

About Rs 10,000 went into boosted posts that were never set up to sell anything. Nine of the twenty campaigns are boosted Facebook or Instagram posts, paid to collect page visits, follows, messages or profile visits rather than orders. Between them they bought 3,000 landing page views, 11,178 follows, 26 message conversations and 27 profile visits. None of them was ever asked for a sale. One of them, a corporate gifting post, never delivered a single impression despite being set up and scheduled.

### Every place the ads were shown, and what each one brought back

At 18 placements, the account has ever paid for. Targeted spend that:

| Placement                               | Spent (Rs)     | Orders     | Revenue (Rs)   | Revenue per Rs spent |
|-----------------------------------------|----------------|------------|----------------|----------------------|
| Facebook & Instagram Feed               | 147,000        | 200        | 147,000        | 1.00                 |
| Facebook Reels                          | 186,750        | 30         | 186,750        | 6.23                 |
| Instagram Reels                         | 47,000         | 10         | 46,000         | 0.98                 |
| Instagram Stories                       | 22,877         | 30         | 46,000         | 2.01                 |
| Facebook Stories                        | 2,000          | 0          | 22,807         | 11.40                |
| In-stream video (video breaks)          | 1,000          | 0          | 0              | 0.00                 |
| Banner & interstitial ads in other apps | 477            | 0          | 0              | 0.00                 |
| Threads Feed                            | 400            | 0          | 0              | 0.00                 |
| WhatsApp & Facebook Status              | 307            | 0          | 0              | 0.00                 |
| Reels video                             | 200            | 1          | 2,700          | 13.50                |
| Facebook profile feed                   | 100            | 0          | 0              | 0.00                 |
| Marketplace                             | 171            | 1          | 1,000          | 5.85                 |
| Search results                          | 37             | 0          | 0              | 0.00                 |
| Explore home                            | 30             | 0          | 0              | 0.00                 |
| Facebook notifications                  | 10             | 0          | 1,000          | 100.00               |
| Right column                            | 11             | 0          | 0              | 0.00                 |
| Instagram search results                | 0              | 0          | 0              | 0.00                 |
| Ads on Facebook Reels                   | 1              | 0          | 0              | 0.00                 |
| Business Inquiries                      | 0              | 0          | 0              | 0.00                 |
| <b>Total</b>                            | <b>285,441</b> | <b>200</b> | <b>766,876</b> | <b>2.69</b>          |

**Four placements carry the whole business.** Feed, Facebook Reels, Instagram Reels and Instagram Stories account for 95% of the Rs 285,441 spent and 97% of the 200 orders. Everything else is noise around the edges.

**Facebook Stories returned Rs 11.40 for every rupee — three times better than anywhere else — and was given under 1% of the budget.** Meanwhile the 2,270 went to in-stream video breaks, banner ads inside other apps, Threads and Status, which between them produced no orders at all.

**Three numbers to read carefully.** Facebook notifications, Marketplace and Reels video all show amazing returns, but an odd or two orders each and a few hundred rupees of spend between them. One order is not a pattern and we should draw no conclusion from any of them.

## Phone or computer

| Where the ad was seen                      | Spent (Rs) | Times shown | Orders | Revenue (Rs) |
|--------------------------------------------|------------|-------------|--------|--------------|
| Inside the Facebook or Instagram phone app | 187,075    | 185,138     | 285    | 176,885      |
| Desktop computer                           | 1,000      | 1,000       | 10     | 10,000       |
| Phone web browser                          | 907        | 1,000       | 10     | 0            |

Almost the entire business is on a phone: **93.8%** of the money and **97.8%** of the orders. Only 10 of 285 orders came from a desktop computer. Everything about how the shop looks and how fast it loads on a phone therefore matters far more than how it behaves on a computer — which is worth building on to when making the page speed results further down.

## Who the ads were shown to

| Age group | Spent (Rs) | Orders | Revenue (Rs) | Cost per order (Rs) | Revenue per Rs spent |
|-----------|------------|--------|--------------|---------------------|----------------------|
| 20-40     | 75,000     | 100    | 176,107      | 750                 | 2.35                 |
| 20-30     | 16,070     | 30     | 176,070      | 536                 | 2.35                 |
| 40-50     | 60,000     | 70     | 167,000      | 857                 | 2.34                 |
| 50-60     | 60,000     | 40     | 60,000       | 1,500               | 1.00                 |
| 60+       | 10,000     | 40     | 71,000       | 250                 | 2.78                 |
| 18-20     | 0,000      | 0      | 0,000        | 0,000               | 0.00                 |

The ads are set to people aged **20** to **60** — but **70%** of the **285** orders came from people older than that. Every ad set we opened has an age limit of 20-60, but the 40-50 group bought 71 times and the over-60s bought 40 times. These orders only happened because Facebook's automatic audience expansion ignored the limit and went looking anyway. The age setting and the system that is actually finding the customers are working against each other.

The **18-20** group was shown the ads **185,000** times and bought **0** times. They are also outside the 20-60 setting, and they are the worst performing group in the account by a wide margin — Rs 1,000 to win an order against Rs 100 for the 20-40 group. 10% of everything the account ever showed went to the age group least likely to buy.

| Gender | Spent (Rs) | Orders | Revenue (Rs) | Cost per order (Rs) | Revenue per Rs spent |
|--------|------------|--------|--------------|---------------------|----------------------|
| Men    | 167,000    | 200    | 167,000      | 835                 | 2.35                 |
| Women  | 160,070    | 100    | 100,000      | 1,601               | 1.00                 |

The budget was split almost exactly in half between men and women, but men bought nearly twice as often and spent more when they did. An order from a man cost Rs 835 to win, an order from a woman cost Rs 1,601 (half the advertising budget — Rs 160,070 — plus an 8% extra that returns the 1,000 per rupee instead of the 5.00).

**Two of the three targeting settings in the live campaign are switched off entirely.** The campaign running now has no interests, no behaviours and no customer lists attached – it is aimed at everyone in Pakistan between 20 and 45, an audience Facebook estimates at 25.8 to 47.8 million people.

**The two retargeting audiences that do exist are not being used.** The account has an audience of people who added something to the basket or visited the website, and another of people who engaged with the Instagram profile – both built on 15 June 2020 and both sitting ready. Neither is attached to the campaign that is running now, and the Instagram one is flagged as not having refreshed. The people who came closest to buying and did not are the cheapest customers an online shop has, and nothing is currently being sent to them.

**There is no audience built from the people who actually bought.** Of the six audiences in the account, four are simple targeting groups by age, gender or city, and two are the retargeting audiences above. There is no lookalike audience – meaning the 200 real buyers have never been used to go and find more people like them, which is the main thing 200 orders' worth of data is good for.

## The ads themselves

| Ad                            | Spent (Rs) | Orders | Revenue (Rs) | Cost per order (Rs) | Revenue per Rs spent |
|-------------------------------|------------|--------|--------------|---------------------|----------------------|
| Reviews                       | 77,100     | 100    | 207,000      | 771                 | 2.69                 |
| Bundle Image - Cheet          | 27,712     | 27     | 66,201       | 1,026               | 1.72                 |
| Matching Bundle video         | 26,760     | 26     | 66,100       | 1,029               | 1.69                 |
| 2 in 1 Matching               | 26,240     | 25     | 66,760       | 1,050               | 1.59                 |
| Harry Chutney and Harry Nohel | 16,880     | 20     | 55,217       | 844                 | 2.75                 |
| Bundle offer                  | 12,225     | 20     | 65,740       | 611                 | 6.79                 |
| Customer Reviewatching        | 10,000     | 0      | 0            | -                   | 0.00                 |

These seven ads account for 76% of everything the account has spent. There are 27 ads in total.

**The best ad in the account got 6% of the budget.** "Bundle offer" returned Rs 6.79 per rupee at the 611 an order – the strongest numbers anywhere in the account – on the 12,225 of spend. At the same time the 27,712 went to "Bundle Image - Cheet", which returned Rs 1.72.

**27 ads are running 26 different pieces of ad text between them, and some of that text is duplicated across separate ads.** Two ads carry word for word the same message ("Matching Bundle offer"), as separate items, and so do two others. Facebook learns which message works by concentrating results, splitting the same message across separate ads stages to learning from either.

**One live ad has spent Rs 10,000 and produced nothing.** "Customer Reviewatching" has been shown 77,000 times with no orders attached to it. It sits inside the awareness campaign, so it was never asked to sell – but it is where a sixth of the account's recent money has gone.

**Nothing new has been put in front of a customer since May.** All live ads running today started on 11 or 12 May 2020 – four and a half months ago. Two of the competitors we looked at launched their ads between 18 and 28 September. Audiences are being shown the same five pieces of creative for months on end, which is what pushes the cost of reaching them up over time.

## Tracking — what the shop can and cannot see

**Not one advert link carries a tracking tag.** Every ad sends people to a plain product address with nothing attached to identify which ad, campaign or audience sent them. That means the only place in the world where a sale can be traced back to an advert is inside Facebook's own reporting. If Facebook's figure is wrong, or is questioned, there is nothing to check it against.

**The website has no analytics of any kind beyond the Facebook tracking code.** There is no Google Analytics and no tag manager installed. Nobody can currently answer how many people visited the shop this month, how many of them bought, where they came from, or which product pages lost people — because nothing is recording it.

### What happens after someone clicks (last 28 days)

| Step                     | People | Share of the 6,000 who viewed a product |
|--------------------------|--------|-----------------------------------------|
| Viewed a product         | 6,000  | 100%                                    |
| Added to basket          | 870    | 14.5%                                   |
| Basket checked out       | 400    | 6.7%                                    |
| Reached the payment step | 180    | 3.0%                                    |
| Completed the order      | 90     | 1.5%                                    |

Taken from the tracking the shop sends to Facebook, 21 August – 27 September 2020.

14.5% of the people who look at a product go on to buy — a solid rate for an online shop, and a sign the offer and the product pages are doing their job. The shop knows in the one place with absolute truth it is.

**400 people started checkout in the last month and 180 reached the payment step.** That is 200 people who had chosen their gear, decided to buy, and then dropped part way through checkout. Everything before that point holds up and everything after it holds up, so this is the one step worth looking at rather than a problem with the shop as a whole.

**The information the shop sends back to Facebook about its visitors is incomplete.** Facebook rates how well it can match a shop's data to real accounts out of ten. Product views score 8.5, basket additions 9.5, checkouts 9.8 and purchases 9.8 — all below the 9.9 that Facebook treats as verifiable. Completed orders score 9.9. The weakest signals are the early ones, which is exactly where the advertising system needs the data to find more buyers.

**The shop's web address has not been confirmed as the business's own inside Facebook.** Facebook flagged this on 28 September. Until it is confirmed, some of the sales made by iPhone users cannot be credited back to the ads that caused them.

**Facebook is warning that advertiser verification may soon be required.** Both the account and the individual campaigns carry this notice. It is not urgent today, but if it is left until Facebook enforces it, the ads stop running until it is completed.

## The website

**Three different free-shipping figures are live on the same page at the same time.** The banner at the top of the shop states between "Free Shipping on orders over Rs.4000" and "Free Shipping on orders over Rs.5000". A second banner on the same page says Rs.4000. The basket's own progress bar – the one that tells a shopper how much more to add – is set to Rs.4000. A customer building a basket to reach free shipping is being told three different targets by the same shop.

**The shipping page promises information it does not give.** It states that it "provides information about delivery charges, estimated delivery times, and the areas we serve", and then gives no delivery charge, no list of areas served and no dates. The only concrete text on the page is "7-8 business working days". A first-time buyer of homemade food, paying in advance, cannot find out what delivery costs or whether the shop delivers to them.

**A product is listed at Rs 10.** "Banana Bread (soft) per order only 1.000" sits in the free catalogue, visible and clickable, priced at ten rupees – against a shop where the next cheapest item is Rs 400. It is also marked "limited" only in its own title while the sale runs across all of Pakistan.

**Four products are out of stock and still listed.** Fruit Fusion mixed fruit jam, Zings Real fruit jam, homemade apple jam and homemade orange marmalade are all unavailable. Ten percent of the range is unavailable, and advertising money is still able to land on those pages.

**None of the  products is filed under a category.** The product type field is empty on every single item. That is what Facebook and Google need to understand what a shop sells, and it is what powers automatic product recommendations in ads – none of which can work on an uncategorised catalogue.

**Advertising money went to product pages that never produced an order.** The strawberry jam page took Rs 2,000 across two ads, organic search brought Rs 710 and the two per orange and strawberry set Rs 210 – with no orders between them. Every ad that did sell well performed at a bundle.

**The plain strawberry jam lists red chilli in its ingredients.** The ingredient list on the Banoffee strawberry jam page reads "Strawberry pulp, Red Chilli, sugar, lemon juice" – the chilli belongs to the separate Blueberry chilli jam and appears to have been copied across. It sits on a page advertising how good it is to send people to, and the whole promise of the product is that a customer can trust what is in the jar.

**The homepage rating is a placeholder that was never filled in.** It reads "Customers rate us 4.8/5 based on helpful early reviews" – the number is missing and the sentence is half in Urdu. The product pages carry no review count at all. For a shop asking a stranger to pay in advance for homemade food, this is the most visible piece of missing proof on the site.

**The homepage claims to be "Pakistan's first jam with 100% fruit pulp".** We could find no public evidence for it or against it. A first in the country claim that cannot be evidenced is the kind of statement a competitor can challenge and Facebook can act on.

How fast the shop loads

Measured on the product page the top spending ad mobile people see, using Google's new Lighthouse test, on 28 September 2020.

|         | Performance | Accessibility | Best Practices | SEO |
|---------|-------------|---------------|----------------|-----|
| Mobile  | 55          | 95            | 77             | 95  |
| Desktop | 95          | 95            | 77             | 95  |

|         | Main content loads | Page frozen for | Layout jumping | Looks ready at |
|---------|--------------------|-----------------|----------------|----------------|
| Mobile  | 6.0 s              | 150 ms          | 0.800          | 3.7 s          |
| Desktop | 1.7 s              | 0 ms            | 0.000          | 1.0 s          |

Mobile

Desktop

On a phone the main image of the product takes 6 seconds to appear. Google's threshold for a good experience is 2.5 seconds. Practically every person who clicks a Facebook or Instagram ad is on a phone, so this is the experience nearly all of the advertising is paying for.

The page moves under the reader's finger while it loads. The layout shift measurement is 0.800 on mobile against a good score of 0.1 or below – the highest reading of anything we measured. This is the effect where a shopper goes to tap "Add to cart", the page jumps, and they tap something else instead. It is measurable on desktop too, at 0.000.

03 How [redacted] compares

Everything below was read from the competitor's own online shop and from Facebook's public ad library on 28 September 2020. These brands no longer exist or are no longer trading – one shop is frozen, one doesn't have a website and one could not be reached – so they are left out rather than guessed at.

The shops [redacted] is competing with

| Shop            | What they sell                           | Free shipping over     | Ads running | What they publish that [redacted] doesn't                             |
|-----------------|------------------------------------------|------------------------|-------------|-----------------------------------------------------------------------|
| Baghera & Bros  | Chocolate, cakes, biscuits               | Rs 2,000               | -100        | 2,000 reviews with a star breakdown, a timeline                       |
| The Spice Store | Chocolate, cakes, biscuits               | Rs 2,000               | -80         | A timeline                                                            |
| Frozen Foods    | Ice-cream and chocolate, mostly 75g jars | Rs 2,000               | -60         | "Loved by over 10,000 customers", a regional origin story             |
| Green Homestead | Frozen foods, plus jam and chocolate     | Rs 100 free fee        | -5          | A named founder with a short story, reviews, couplets on each product |
| Anna's Naturals | All natural jam and sweets               | Rs 2,000               | -5          | A full ingredient list, 2,000 reviews, named shops that stock them    |
| An Abode        | Jam only                                 | Not published          | 0           | A named founder, a full street address, shelf life                    |
| House Foodways  | House-grown and other jam                | In items in the basket | 0           | Star rating with a count, company registration                        |
| Spice           | Biscuits and sweets                      | Not published          | -5          | Supermarket distribution alongside its own shop                       |

"No additives" is not a point of difference in this market — seven of the eight shops say it. Competitors use the words "100% chemical free", "no artificial flavors, no colors, and no preservatives", "preservative free" and "nothing artificial added, ever". What almost none of them do is prove it: only one publishes a full ingredient list, and only one publishes a shelf life. The claim itself no longer separates anybody.

[redacted] s free-shipping threshold is the highest in the set, and it is the only one stated two different ways. Two competitors set theirs at Rs 2,000 and one at Rs 2,000 – roughly half [redacted] s. A shopper comparing shops sees [redacted] asking for around twice the basket before delivery shops costing extra.

The spending industry also is falling. Across roughly 170 competitor ads running in Pakistan today, not one is advertising jam or biscuits. Every third with a real advertising budget is fighting over cakes, chocolate and biscuits. [redacted] is the only shop advertising in jam and biscuits at all – an open act, and the account's own numbers say the demand is there to work with.

Two competitors are outperforming [redacted] heavily. Baghera & Bros has around 100 ads running in [redacted] s with, leading with a flat 20% off its target goods and a Rs 200 seven-flavor trial pack. Frozen Foods with 10% off combinations, [redacted] was no offer at all. There is also a pattern worth noting: the cake and chocolate shops send a large share of their ads straight into WhatsApp rather than to a product page.

## 04 What we would do about it

---

This is a friendly review, so what follows is direction rather than a task list. Everything here points back to something specific in sections 02 and 03.

### Build one new campaign, and let the account's own results decide how

Rather than switching the old campaigns back on, we would start a single new selling campaign. Eight months of results already say what it should look like, and every choice below comes straight out of the tables in section 03.

- **Only the places that have actually sold.** **Feed, Facebook Reels, Instagram Reels and Instagram Stories produced 377 of the 380 orders.** Facebook Stories gets a proper share for the first time – it has the best return in the account and has never had more than scraps. Everything else is turned off.
- **The ages that buy, not the ages that were sold.** The 25–34 best comes off. The 25–34 and 25–34 groups take the weight, the over-45s stay in because they have placed 134 orders between them, and the 18–24s come out because they have taken 12% of everything ever shown and returned almost nothing.
- **Men and women in separate ad sets, with the budget split to match what each returns.** They currently sit together and the money lands roughly half and half, while an order from a man costs £6.580 and an order from a woman costs £6.120. Separating them is the only way to fund each at what it is actually worth instead of averaging the two.
- **Bundles best.** Every strong number in the account belongs to a bundle – the best campaign, the best ad, the lowest cost per order. Single ads take the supporting role, not the budget.
- **Fresh creatives.** The same old ads have been running since May, while the shops outperforming [redacted] put new ones out every couple of weeks.
- **The awareness campaign and the boosted posts stop.** Awareness is a reasonable thing to buy once a shop is selling profitably. It is an expensive thing to buy instead of selling.

### Put the audiences to work

- The basket abandonment and website visitor audience already exists and is attached to nothing. It should be running, and running free, because those people are the cheapest orders available to this shop.
- An audience built from the 380 people who actually bought, used to go and find more people like them. That is the main thing eight months of sales data is good for, and it has never been done.
- The Instagram engagement audience needs refreshing – it is currently flagged as not updated.

### Fix what the advertising cannot see

- Every advert link should carry proper campaign tagging so a sale can be traced back to the ad that caused it outside of Facebook's own word for it.
- The shop needs independent analytics installed. At the moment there is no way to answer basic questions about traffic, and no second opinion on anything Facebook reports.
- The date the shop sends back to Facebook needs strengthening so the early signals score above the volatile line. Better data going in is what lowers the cost of every order coming out, and it is also what makes an audience built from real buyers worth having.
- The web address should be confirmed inside Facebook, and advertiser verification completed before Facebook forces the issue and the ads stop.

### Fix what is losing the sale after the click

- The free shipping threshold has to be one number, everywhere – and it is worth asking whether that number should be this high. Three different figures on one page is the sort of thing a careful shopper notices, and careful shoppers

are the ones who buy homemade food from a shop they have not used before. Competitors are asking for roughly half the budget.

- The reviews need to go on the site properly. The homepage currently carries an unfinished placeholder where a review count should be, while the two shops advertising hardest against [redacted] both publish thousands with a star breakdown. In a category built on trust, this is the cheapest gap on the list to close.
- The strawberry jam ingredient list needs correcting, and the "Pakistan's first" claim on the homepage needs either evidence behind it or removing.
- The shipping page should actually state the delivery charge and the areas served. Buying homemade food online is an act of trust, and a page that promises these answers and withholds them costs more than a page that never promised.
- The 16 product and the four add-on items should be dealt with before more advertising money reaches them.
- The catalogue needs categories. Without them the automatic product features in both Facebook and Google are simply unavailable to this shop.
- The phone experience of the page the ads point at needs attention – six seconds to show the product and a layout that shifts while the shopper is reaching for the button. This is website work rather than advertising work, and we can take it on separately if that is useful.

**Where the money actually is.** The shop already converts well – 10% of the people who view a product buy something, and the advertising has returned the £400 for every rupee across 280 orders. The largest opportunity in this report is not a broken funnel, it is that almost none of that machinery is switched on, and that the money which did go out was spread evenly across audiences and placements the account's own figures say are worth very different amounts. Turning the selling back on, pointed at the people and places that have already bought, is the single biggest move available.

One thing this report deliberately does not do is put a number on what any of the above will return. The £400 for every rupee is what that account has done so far – it is a record, not a forecast.
